

GAME ANALYSIS WITH SQL

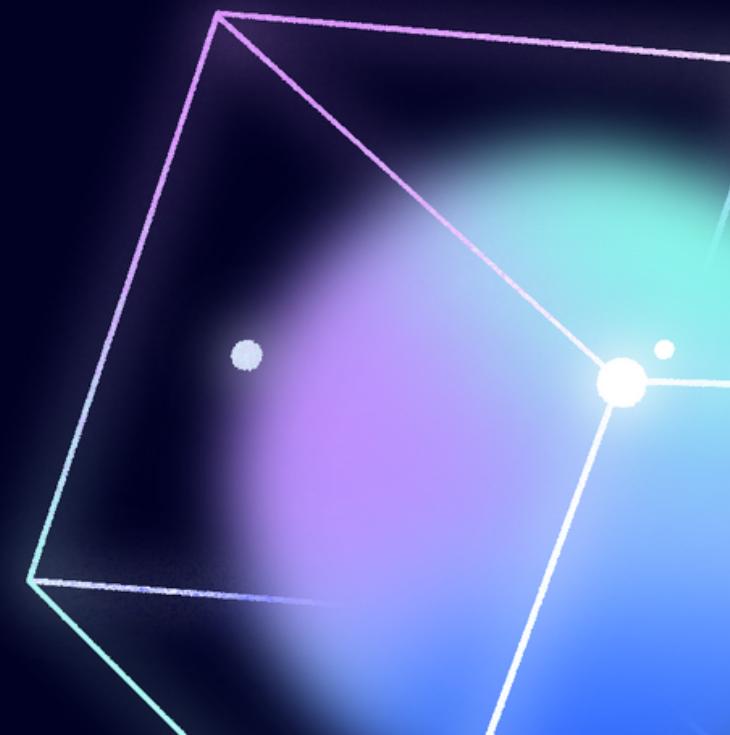

K.NIKHITHA

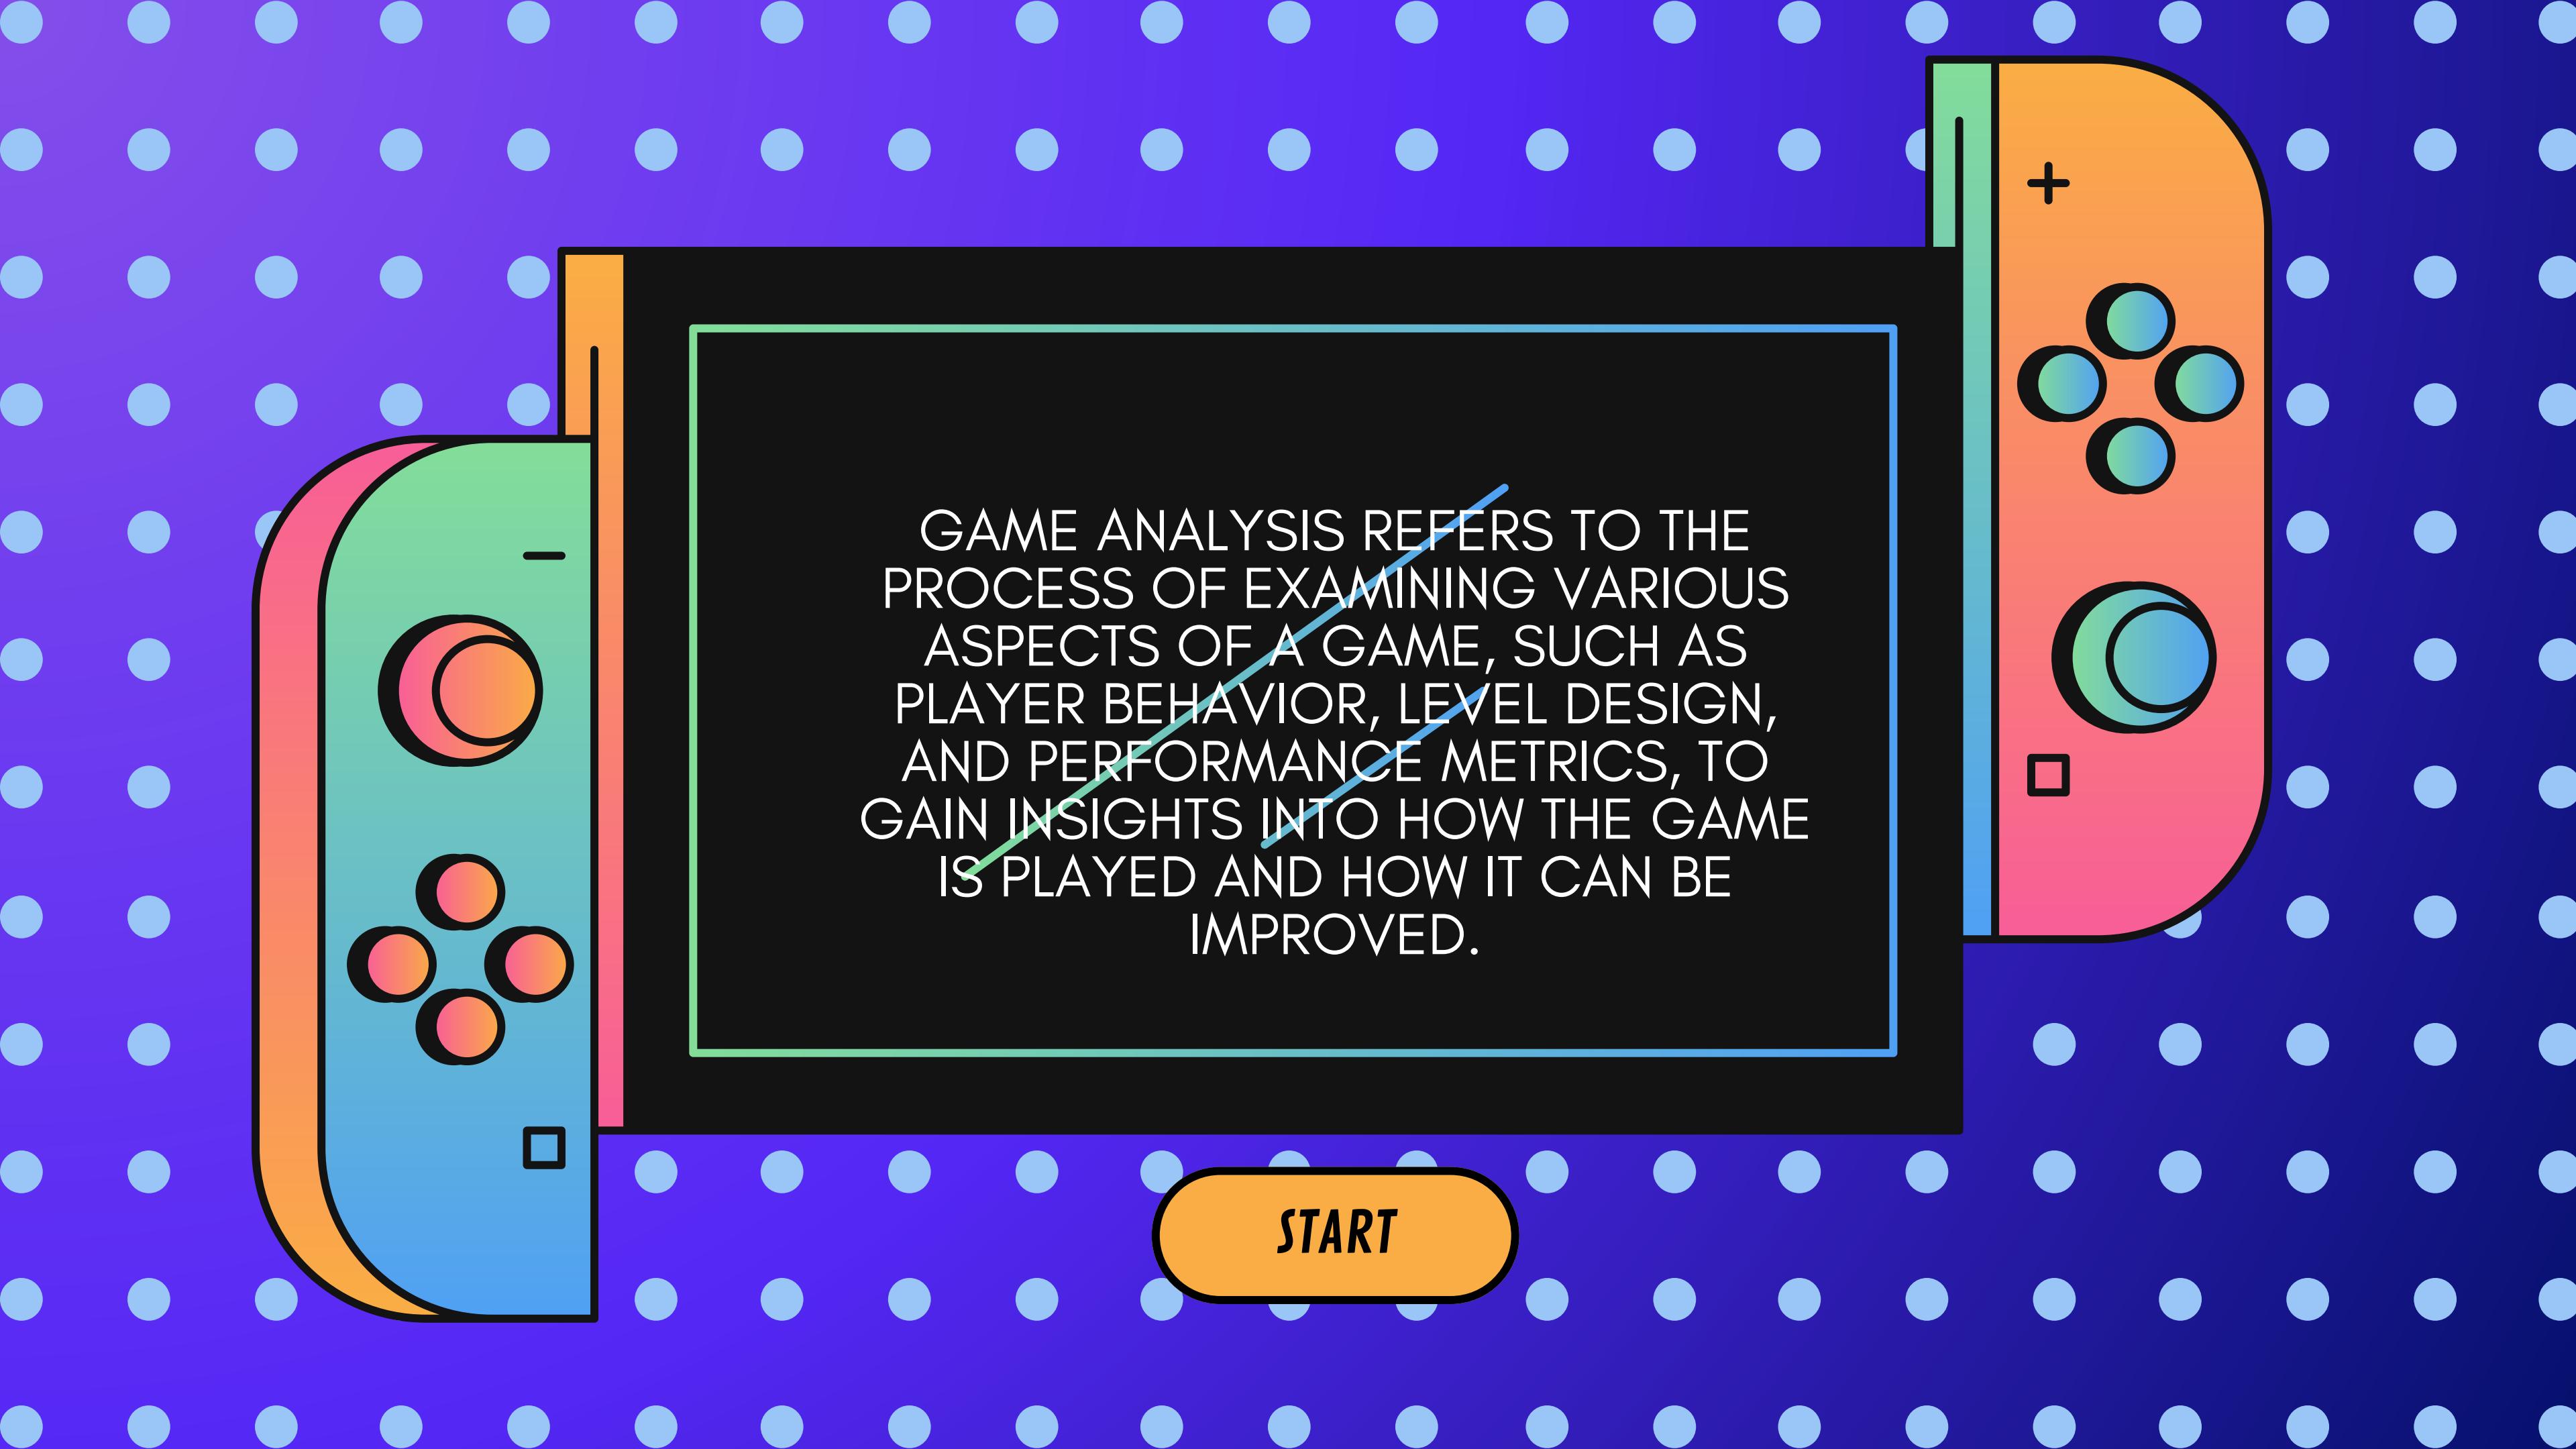

INTRODUCTION TO SQL

SQL stands for Structured Query Language. It's a language used to interact with databases, allowing users to perform tasks like retrieving data, updating records, and managing database structure.

GAME ANALYSIS REFERS TO THE PROCESS OF EXAMINING VARIOUS ASPECTS OF A GAME, SUCH AS PLAYER BEHAVIOR, LEVEL DESIGN, AND PERFORMANCE METRICS, TO GAIN INSIGHTS INTO HOW THE GAME IS PLAYED AND HOW IT CAN BE IMPROVED.

START

In this project, we will be working with a dataset related to a game. The dataset includes two tables: Player Details and Level Details.
There are 15 questions for which you have to find the answers by writing SQL queries.

```
-- Q1) Extract P_ID,Dev_ID,PName and Difficulty_level of all players  
-- at level 0  
-- Q2) Find Level1_code wise Avg_Kill_Count where lives_earned is 2 and atleast  
--      3 stages are crossed  
-- Q3) Find the total number of stages crossed at each diffuculty level  
-- where for Level2 with players use zm_series devices. Arrange the result  
-- in decsreasing order of total number of stages crossed.  
-- Q4) Extract P_ID and the total number of unique dates for those players  
-- who have played games on multiple days.  
-- Q5) Find P_ID and level wise sum of kill_counts where kill_count  
-- is greater than avg kill count for the Medium difficulty.  
-- Q6) Find Level and its corresponding Level code wise sum of lives earned  
-- excluding level 0. Arrange in asecending order of level.  
-- Q7) Find Top 3 score based on each dev_id and Rank them in increasing order  
-- using Row_Number. Display difficulty as well.  
-- Q8) Find first_login datetime for each device id  
-- Q9) Find Top 5 score based on each difficulty level and Rank them in  
-- increasing order using Rank. Display dev_id as well.  
-- Q10) Find the device ID that is first logged in(based on start_datetime)  
-- for each player(p_id). Output should contain player id, device id and  
-- first login datetime.  
-- Q11) For each player and date, how many kill_count played so far by the player. That is, the total number of games played -- by the player until that date.  
-- a) window function  
-- b) without window function  
-- Q12) Find the cumulative sum of stages crossed over a start_datetime  
-- Q13) Find the cumulative sum of an stages crossed over a start_datetime  
-- for each player id but exclude the most recent start_datetime
```

DATASET

PLAYER DETAILS

- P_ID: Player ID
- PName: Player Name
- L1_status: Level 1 Status
- L2_status: Level 2 Status
- L1_code: Systemgenerated
Level 1 Code
- L2_code: Systemgenerated
Level 2 Code

LEVEL DETAILS

- P_ID: Player ID
- Dev_ID: Device ID
- start_time: Start Time
- stages_crossed: Stages Crossed
- level: Game Level
- difficulty: Difficulty Level
- kill_count: Kill Count
- headshots_count: Headshots Count
- score: Player Score
- lives_earned: Extra Lives Earned

Following are the 2,3 answers examples of SQL queries.

The screenshot shows a SQL query editor interface with a dark theme. The top menu bar includes File, Edit, View, Query, Database, Server, Tools, Scripting, and Help. Below the menu is a toolbar with various icons. The main area is titled "GAME ANALYSIS" and contains four numbered SQL scripts:

- 1 •

```
select * from ld;
```
- 2 •

```
select * from pd;
```
- 3 •

```
# 1. Extract `P_ID`, `Dev_ID`, `PName`, and `Difficulty_level` of all players at Level 0 --  
SELECT a.P_ID, b.Dev_ID, a.PName, b.Difficulty, b.Level  
FROM ld as b, pd as a  
WHERE b.Level = 0;
```
- 4 •

```
# 2. Find `Level1_code` wise average `Kill_Count` where `lives_earned` is 2, and at least 3 stages are crossed.--  
SELECT a.L1_Code, AVG(b.Kill_Count) AS Average_Kill_Count  
FROM pd as a  
JOIN ld as b  
ON a.P_ID = b.P_ID  
WHERE b.Lives_Earned = 2  
GROUP BY a.L1_Code  
HAVING COUNT(DISTINCT b.Stages_crossed) >= 3;
```
- 5 •

```
# 3. Find the total number of stages crossed at each difficulty level for Level 2 with players using `zm_series` devices. Arrange the result in decreasing order of the total number of  
SELECT difficulty,  
       sum(stages_crossed) AS total_stages_crossed,  
       count(stages_crossed) AS totalcount_stages_crossed  
FROM ld  
WHERE level = 2  
AND Dev_ID Like 'zm_%'  
GROUP BY difficulty  
ORDER BY total_stages_crossed DESC;
```
- 6 •

```
# 4.Extract `P_ID` and the total number of unique dates for those players who have played games on multiple days.--  
SELECT P_ID, COUNT(DISTINCT date (start_datetime)) AS unique_dates  
FROM ld
```

The left sidebar includes sections for Navigator, Schemas, Administration, and Object Info. The bottom navigation bar includes tabs for Object Info and Session.

CONCLUSION

"INSIGHTS FROM THIS ANALYSIS CAN INFORM GAME DESIGN DECISIONS AND IMPROVE PLAYER ENGAGEMENT."

THANK YOU!
